Durable Temperature and Humidity Sensor

Overview

The durable temperature and humidity sensor (Model number HTY1000T1100, HTY1010T1100) is a highly precise and reliable sensor using the resistance temperature detector (Pt100, JIS C1604 class A) for the temperature sensor and the macromolecule capacitance type humidity sensor, FP4™ developed by Azbil Corporation. In addition to highly precise temperature/humidity measurement, it has functions to detect and recover the drift* caused by the chemical atmosphere in the laboratory or factory facilities.

* Drift is a phenomenon that output error of the humidity element becomes larger due to aging. JIS: Japanese Industrial Standards

Safety Precautions

Please read instructions carefully and use the product as specified in this manual. Be sure to keep this manual nearby for quick reference.

Restrictions on Use

This product was developed, designed, and manufactured for general air conditioning use. Do not use the product in a situation where human life may be at risk or for nuclear applications in radiation controlled areas. If you wish to use the product in a radiation controlled area, please contact Azbil Corporation.

Particularly when the product is used in the following applications where safety is required, implementation of fail-safe design, redundant design, regular maintenance, etc., should be considered in order to use the product safely and reliably.

- Safety devices for protecting the human body
- Start/stop control devices for transportation machines
- Aeronautical/aerospace machines

For system design, application design, instructions for use, or product applications, please contact Azbil Corporation.

Azbil Corporation bears no responsibility for any result, or lack of result, deriving from the customer's use of the product.

Recommended Design Life

It is recommended that this product be used within the recommended design life.

The recommended design life is the period during which you can use the product safely and reliably based on the design specifications.

If the product is used beyond this period, its failure ratio may increase due to time-related deterioration of parts, etc.

The recommended design life during which the product can operate reliably with the lowest failure ratio and least deterioration over time is estimated scientifically based on acceleration tests, endurance tests, etc., taking into consideration the operating environment, conditions, and frequency of use as basic parameters.

The recommended design life of this product is 10 years.

The recommended design life assumes that maintenance, such as replacement of the limited life parts, is carried out properly.

Refer to the section on maintenance in this manual.

Warnings and Cautions

| WARNING | Alerts users that improper handling may cause death or serious injury. |
| CAUTION | Alerts users that improper handling may cause minor injury or material loss. |

Signs

- Alerts users possible hazardous conditions caused by erroneous operation or erroneous use. The symbol inside △ indicates the specific type of danger. (For example, the sign on the left warns of the risk of electric shock.)

- Notifies users that specific actions are prohibited to prevent possible danger. The symbol inside ○ graphically indicates the prohibited action. (For example, the sign on the left notifies that disassembly is prohibited.)

- Instructs users to carry out a specific obligatory action to prevent possible danger. The symbol inside • graphically indicates the actual action to be carried out. (For example, the sign on the left indicates general instructions.)

- WARNING
  - Do not use the product in the environment that chemical concentration of special inflammable materials is high enough to ignite at 180 °C or less. Doing so might cause fire.
  - While [HEAT] lights up, do not touch the element. Doing so might cause burns because it is heated at 180 °C.

- CAUTION
  - Use this product under the operating conditions (for temperature, humidity, power, vibration, shock, mounting direction, atmosphere, etc.) listed in the specifications. Failure to do so may cause fire or device failure.
  - Installation and wiring must be performed by qualified personnel in accordance with all applicable safety standards.
  - All wiring must comply with applicable codes and ordinances.
Before wiring or servicing, be sure to turn off the power to this product. Failure to do so may cause electric shock or device failure.

Provide a cutoff device such as a circuit breaker for the power source to the product.

After wiring or engineering work, be sure to reattach the cover to the original position. Failure to do so may cause electric shock.

If more than the rated power voltage is applied to the product, replace the product with new one for your safety. Failure to do so may cause fire.

Do not use transceivers or low power wireless devices near this product. Doing so may cause radio wave interference and malfunction of the product.

Do not disassemble the product. Doing so may cause electric shock or device failure.

Do not mount the indoor temperature/humidity sensor in locations such as the following. Temperature/humidity may not be correctly measured.
- Where air circulation is interfered.
- Where temperature, humidity, or air velocity is not stabilized such as near the doorway.
- Where affected by draft, down flow, cold/hot wind form water pipe or duct, or radiated heat.
- Where affected by airflow caused by a conduit located at the back side of a wall.
- Where environment between the right sensor and the left sensor is different.
- Where temperature difference between the right sensor and the left sensor varies.
- Where temperature difference between the sensor element and the case is ±1 °C or more.

Do not mount the duct temperature/humidity sensor in locations such as the following. Temperature/humidity may not be correctly measured.
- Where pressure difference between internal and external of a duct is 10 kPa or more.
- Where temperature difference between internal and external of a duct is 30 °C or more.
- Where droplets of water, due to humidification by steam diffusive atomization or condensation in ducts, directly attach on the sensor element.

IMPORTANT • Be careful so as not to pinch fingers while opening or closing the cover.

Cautions for connecting to system

When this product fails, a room or duct might be over humidified due to decline of its output. Implement the safety measures such as setting of the alarm function, or independent safety measures by the controller. When specific errors are detected, the maximum analog value, voltage: 5.6 V or current: 22.4 mA, will be output for one minute. Design the system so that this analog value is detected by the connected controller.

Cautions for installing this product

Do not install the product in the following environments. Doing so may cause malfunction of the device or device failure in a short period of use.
- Where exposed to direct wind or rain.
- Where droplets of water may drop.
- Where exposed to direct sunlight.
- Where vibrations or shocks are applied.
  (Outside of the specifications)
- Where exposed to steam directly.
  (When the product is mounted to the HVAC such as steam humidification system)
- Where chemicals or oils are adhered.
  (Chemical cracks might be made on the case. When they are adhered, wipe them immediately with a dry soft cloth.)
• Notes for measurement

- Precision when the product was shipped from the factory is specified.
  Although the product is used within the specifications, precision might deteriorate due to aging. In order to maintain the precision of the product, do the regular maintenance.
- Be sure to attach the filter to the product.
  If the filter is not attached, the humidity-measuring element may fail within a short period of time.
- If the product is exposed to high temperature and humidity atmosphere or chemicals such as organic solvent, the output from the sensor might drift.
  Although the element is heated, the drift might not be recovered completely.
  For details, refer to ■ Troubleshooting.
- After powering on, the two sensors is heated one time, and then measurement will start normally.
  For details, refer to ■ Functions.
- Ambient temperature change around the case might deteriorate precision of the product.
  For details, refer to ■ Specifications.
- If the cover is opened while measuring, the output may vary due to temperature change around the circuits.
- If a measurement, temperature, humidity error occurs between the two sensor, the sensor 2 is tuned to be the same value with the sensor 1 by adjusting the start time of heating.
  Therefore, if the temperature difference varies, measurement errors will be made.
- Temperature on the surface of wall is different from that of atmosphere, the measurement value might be affected.
- The settings and the accumulated heating time are saved in the nonvolatile memory. The saved data will not be erased by power off. However, be aware that the data is saved only when the [enter] key is pressed or the heating process ends.
  If the power is off before pressing the [enter] key or completing the heating process, the settings or the accumulated heating time updated last might not be saved.
Features

(1) The product enables wide range of temperature and humidity sensing with high accuracy.

(2) The product has a new temperature/humidity element FP4 that was developed by Azbil Corporation and enables simultaneous measuring the temperature and humidity, and special functions. The following features are provided:

- Drift recovery function
  In order to minimize the output drift, the element is treated in the elevated temperature to vaporize the remained chemicals in the polymer.

- Drift detection function
  Periodically compares the measured value with the internal reference value to detect the drift.

(3) The product has double elements to enable continuous measurement during while detecting or recovering drift of the element.

(4) The element is replaceable.

(5) Measurement output function
  Outputs measured temperature, humidity, and dew point temperature in analog (1–5 V or 4–20 mA).

(6) CE marking
  This product conforms to the standards for CE marking.

**1** Standard accuracy is for the measurement of standard operating conditions. Also, it should satisfy the following conditions.
- Temperature: ±0.1 °C, humidity: 0.1 % RH, and dew point: 0.1 °C Td.
- The accuracy is defined for the indications on the LCD. For the voltage/current output, the conversion accuracy should be added.
- The accuracy is defined when the product is shipped. It may deteriorate over long time use.

**2** 1 digit means temperature: 0.1 °C, humidity: 0.1 % RH, and dew point: 0.1 °C Td.

**3** Accuracy after replacing the element is as follows:
- Temperature: ±0.3 °C ± 1 digit (at standard temp. 25 ± 2 °C)
- Humidity: ±3 % RH ± 1 digit (at standard humidity 50 % RH, temp. 25 ± 2 °C)

**4** For details of the accuracy for humidity and dew point, refer to Fig. 1–4.

**5** The supercooled saturated water vapor pressure is used for the dew point lower than 0 °C.

**6** The accuracy of the sensor for ducts is affected by the ambient temperature of the case.

**7** The temperature characteristics of the case are described below. (|t|: the absolute value of the difference between case ambient temperature and the reference temperature of 25 °C)
- Temperature: ±0.02|t| °C
- Relative-humidity: ±0.09|t| % RH
- Dew point temp.: ±0.03|t| °C Td (50–100 % RH), ±0.05|t| °C Td (30–50 % RH), ±0.07|t| °C Td (20–30 % RH), ±0.14|t| °C Td (10–20 % RH)

**8** If there is a temperature difference between inside and outside of the duct, a temperature error occurs on the sensor 2 for duct use. This temperature error is automatically corrected by the correction between sensors function. The temperature error, without correcting the difference between sensors, is estimated at ±0.6 °C when the temperature difference between inside and outside of the duct is 30 °C and air velocity in the duct is 1 m/s.

**9** It is accuracy when an indicated value is converted to an output. ±1/2 digit is added separately.

**10** For this reason, there is a discrepancy between the displayed value on the unit and the received value.

Ex.: If the sensor is used indoors, output is 1–5 V, and ambient temp. is 35 °C, the conversion error of temperature output (∆t) is given as follows:

Full scale calculation: ±0.05 x 25 + 0.01|t| = ±0.15 ± 0.15 % F.S.

When engineering unit conversion is applied for ±0.15 % F.S., it will be ±0.15 % F.S. x 50/100 = ±0.075 °C since the temperature range for indoor sensor is 0–50 °C. Since 1 digit of a temperature display is 0.1 °C, 1/2 digit is 0.05 °C.

Therefore, the output conversion accuracy (∆t) is given as: ∆t = ±0.075 + 0.05 = ±0.125 °C.

Ex.: If the sensor is used for a duct, output is 1–5 V, case ambient temp. is 35 °C, and the measurement source is 20 °C, 10 °C Td, the output accuracy of dew point is given as follows:

Output accuracy = Apparatus accuracy ± Temperature characteristics of case ± Output conversion accuracy ± Temperature characteristics of case ± 0.75 °C ± 0.15 % F.S.

Ex.: If the sensor is used indoors, output is 1–5 V, and ambient temp. is 35 °C, the output accuracy of dew point is given as follows:

Output accuracy = ±0.15 ± 0.15 % F.S. ±0.15 ± 0.15 % F.S.

Since range of the dew point temperature sensor is 100 °C Td, ±0.15 % F.S. = ±0.15 °C Td, and then the output conversion accuracy is ±0.15 ± 0.15 % F.S. ±0.15 °C Td.
Figure 1. Indoor sensor, humidity accuracy

Figure 2. Duct sensor, humidity accuracy

Figure 3. Indoor sensor, dew point temperature accuracy

Figure 4. Duct sensor, dew point temperature accuracy (case ambient temperature: 25 °C)

(Note) 1. Dew point temperature is calculated from the measurement accuracy of temperature and humidity.
2. For the duct sensor, assumes no influence from the case temperature.
# CE Marking Conformity

This product complies with the following Electromagnetic Compatibility (EMC).

EMC: EN61326-1 Class A, Table 2 (For use in an industrial electromagnetic environment)
CISPR11

### Output Changeover

**IMPORTANT** • The output signal can be switched, voltage output (1–5 V) or current output (4–20 mA), by setting the output changeover switch (S1).

- Set the switch according to the output destination.
- If the output signal setting is incorrectly set, the device connected to the output might be damaged.
- Do not apply excessive force to the output changeover switch. Doing so may damage the product.

1. Loosen the screw on the case cover to open the cover.
2. Check the setting position of the output changeover switch (S1) inside the case. The output changeover switch (S1) is located at the lower position of the terminal block.
3. Select the output signal, voltage output (1–5 V) or current output (4–20 mA), by setting the output changeover switch (S1). Factory preset is voltage output 1–5 V.

![Output changeover switch](image)

### Installation

**CAUTION**

- Use this product under the operating conditions (for temperature, humidity, power, vibration, shock, mounting direction, atmosphere, etc.) listed in the specifications. Failure to do so may cause fire or device failure.

- Installation and wiring must be performed by qualified personnel in accordance with all applicable safety standards.

**IMPORTANT** • Installation work might be carried out in a chemical environment. In this case, check the chemicals used and take necessary measures according to the chemicals.
- Do not step on the product.
- If an insufficient heating occurs with the temperature/humidity element, the maximum analog value, voltage: 5.6 V or current: 22.4 mA, will be output for one minute. The maximum analog value must be detected by the connected controller.
- Be sure to attach the filter to the product. If the filter is not attached, the humidity-measuring element may fail within a short period of time.

**Installation location**

- **< Indoor temperature/humidity sensor >**
  - Mount the product on a wall 1.5 m above the floor where typical temperature of a room can be measured.
  - Mount the product where 0.15–0.45 m/s air velocity is allowed.

  *(Note) When mounting, be sure to secure the maintenance space shown in Maintenance space.*

- **< Duct temperature/humidity sensor >**
  - Mount the sensor where typical temperature/humidity in a duct can be measured and the rated operating conditions are secured.
  - Mount the product where air flows on the side of the sensor unit.
  - Adjust to match the airflow direction indicated on the sensor unit (stamp) the actual airflow direction.

  *(Note) When mounting, be sure to secure the maintenance space shown in Maintenance space.*
• Maintenance space
  • Sensor unit
    Side: Min. 300 mm
  • Operation panel
    Front: Min. 600 mm
    Top/bottom: Min. 200 mm

Figure 12. Maintenance space

• Prohibited installation location

Do not install the product in the following environments. Doing so might cause malfunction of the device or device failure in a short period of use.
- Where exposed to direct wind or rain.
- Where droplets of water may drop.
- Where exposed to direct sunlight.
- Where vibrations or shocks are applied.
  (Outside of the specifications)
- Where exposed to steam directly.
  (When the product is mounted to the HVAC such as steam humidification system)
- Where chemicals or oils are adhered.
  (Chemical cracks might be made on the case. When they are adhered, wipe them immediately with a dry soft cloth.)

< Prohibited installation location for indoor temperature/humidity sensor >

Do not mount the indoor temperature/humidity sensor in locations such as the following. Temperature/humidity may not be correctly measured.
- Where air circulation is interfered.
- Where temperature, humidity, or air velocity is not stabilized such as near the doorway.
- Where affected by draft, down flow, cold/hot wind form water pipe or duct, or radiated heat.
- Where affected by airflow caused by a conduit located at the back side of a wall.
- Where environment between the right sensor and the left sensor is different.
- Where temperature difference between the right sensor and the left sensor varies.
- Where temperature difference between the sensor element and the case is ±1 °C or more.

< Prohibited installation location for duct temperature/humidity sensor >

Do not mount the duct temperature/humidity sensor in locations such as the following. Temperature/humidity may not be correctly measured.
- Where pressure difference between internal and external of a duct is 10 kPa or more.
- Where temperature difference between internal and external of a duct is 30 °C or more.
- Where droplets of water, due to humidification by steam diffusive atomization or condensation in ducts, directly attach on the sensor element.
Notes for installation

IMPORTANT • Be careful so as not to pinch fingers while opening or closing the cover.

- Do not get a cable caught when the case cover is closed.
- If the cable for the sensor unit is pulled strongly, the cable may be slipped off.
- By bringing a hand etc. close to the sensor unit, it may be damaged by electrostatic discharge.

< Duct sensor >
- Do not mount the sensor unit upward at the bottom of the duct.
- Minimum bending radius of the sensor cable is 30 mm.
- Fix the sensor cable by a cable tie.
  If the cable moves during measurement, the output may get unstable temporarily.
- Be sure to use the cable gland mounting set (ordered separately, P/N: 83157240-004) or the seal connector (ordered separately, P/N: 83104098-004).
  If both the cable gland mounting set and the seal connector are not used, the protective level IP-54 cannot be secured.
- If connectors for the cable gland is used, mount the cable gland downward.

Installation procedure

< Indoor sensor >
Preparation
  • Box cover
    JIS C8340: 1999, for outlet box, mounting pitch 66.7 mm

Dimensions of cover with JIS flange (mm)
(for medium size square box, commercial part)

Figure 13. Box cover

(1) Loosen the screw on the case cover to open the cover.
  The cover opens to 160 degrees toward you.

Figure 14. Position of grommet

(2) Make a hole in the grommet with a screw driver etc.

(3) Pass the cable through the grommet.

(4) Attach the case on the box cover with the accessory mounting screws (M4, L = 10, 2 pcs).

Figure 15. Attaching case
(5) Check the setting position of the output changeover switch inside the case.

(6) Close the case cover.

< Duct sensor >

Preparation
• Mounting bracket (P/N: 83157235-001)
• Mounting bracket for main unit (P/N: 83170626-004)

(1) Stick the hole-opening label (P/N: 83157193-001) where the sensor should be mounted.

(2) Make holes as follows:
  • Mounting bracket for main unit: φ3.5×3
  • For duct: φ3.5×3, φ31×1

(Note) Space between the hole-opening labels should be 400 mm or less. If the space is over the specified, the cable of a sensor unit may not reach.

(3) Place the longer mounting bracket toward you, insert the packing, and then fasten the mounting bracket with the accessory tapping screws (x3).

(4) Wind heat insulation material around the duct as necessary. If the duct is covered with heat insulation, remove the insulation partially to attach the mount bracket. After attaching the bracket, fill any gaps with the thermal insulation.

(5) Fasten the mounting bracket for the main unit to the duct with the accessory tapping screws (x3).

(6) Attach two screws (M4, x2) at the lugs on both sides of mounting bracket for main unit. To avoid overtightening the M4 screws, leave space under the screw heads.

(7) Insert the lugs of case under the M4 screw heads that are fastened at the lugs of mounting bracket for main unit.

(8) Fasten the case to the mounting bracket for main unit with the M4 screws (x2).

(9) Turn the stopper of the sensor unit to the opposite direction to the LOCK arrow.
(10) Align the tab with the slit on the mounting bracket, and then insert the sensor unit into the duct through the hole on the mounting bracket for the sensor.

(11) When the sensor unit is firmly inserted, turn the stopper 45 degrees to the direction of the LOCK arrow. The sensor unit is fastened to the mounting bracket.

(12) Open the case cover to check the setting position of the output changeover switch inside the case.

(13) Close the case cover.

■ Wiring

**CAUTION**

- Installation and wiring must be performed by qualified personnel in accordance with all applicable safety standards.
- All wiring must comply with applicable codes and ordinances.
- Before wiring or servicing, be sure to turn off the power to this product. Failure to do may cause electric shock or device failure.
- After wiring or engineering work, be sure to reattach the cover to the original position. Failure to do so may cause electric shock.

- Notes for wiring
  - If the connectors for cable gland are used, use the O-ring included in the cable gland attachment kit (ordered separately, P/N: 83157240-004) and the specified shield multi-core cable.

- Wiring procedure
  1. Prepare appropriate parts according to the number of cores in the cable used.
     - When the seal connector is used
       Seal connector (ordered separately, P/N: 83104098-004)
     - When the cable gland is used
       Cable gland attachment kit (ordered separately, P/N: 83157240-004)
  2. Loosen the screw on the case cover to open the cover.
  3. If the sensor is used for ducts, pass the cable.
     (Note) If the sensor is used indoors, go to the step (3).

- When the seal connector is used
  1. Fasten the seal connector to the case with a screw.
  2. Pass the cable.
  3. Hold the cable and fasten it.

- When the cable gland is used
  1. Temporarily assemble the cable gland connector and the attachment (cable gland set) with a screw.
Select a suitable O-ring for the cable used.
Pass the cable.
Pull the cable upward and fasten the attachment to the case with a screw.
Tighten the nut (accessory of the cable gland) at the location where the screw for fastening the cable gland is easily accessed.

Connect wires to the terminal blocks.
M3.5 round crimping terminal with insulating tube or with insulating caps should be used.

Close the case cover and fasten it with the screws.
Check that the wiring has been done correctly again.
Turn on the power switch.
Functions

Basic operation

There are two sensors, sensor 1 and sensor 2. When one of the two sensors is being heated, measurement is carried out by the other one and the results can be output. Each sensor has two measuring modes, measuring and non-measuring mode. When one sensor is in the measuring mode, its measured value will be displayed on the LCD and be output as an analog value. The other one is in non-measuring mode.

1. After the power is ON, waits the amount of time defined by Heating Start Delay Time, and then starts the first heating.
2. The non-measuring sensor (sensor 1 or sensor 2) will be heated for the period (minutes) defined by heating time. *1
   While the sensor is being heated, [HEAT] lights up.
3. When heating is completed, the sensor will be cooled down for 30–60 minutes. While the sensor is being cooled down, [HEAT] blinks.
4. When cooling down is completed, the sensor will be switched in the measuring mode.
5. When the amount of time defined by Heating Cycle Time elapses, next heating starts for the non-measuring sensor.

(Note) Also, sensor 2 can be the measuring sensor when the power is turned on.

*1 While heating operation, if the minimum of humidity measured by the sensor being heated does not fall less than 10 % RH, extends the heating time maximum 30 minutes.
   After extending heating, when the humidity falls less than 10 % RH, heating will be stopped.
   In this case, if the drift 1 is detected, the error (E-30) will occur.
   If the next heating is carried out normally, E-30 will be canceled automatically.
   If E-30 occurs frequently, take a measure from the followings.
   • Extend the heating time.
   • Shorten the heating cycle.

Correction between two sensors

If a measurement, temperature, or humidity error occurs between the two sensor, the sensor 2 is tuned to be the same value with the sensor 1 by adjusting the start time of heating.
Environmental-resistant function

This temperature/humidity sensor, FP4 developed by Azbil, consists of two elements: Temperature sensing element (resistance temperature detector Pt100) and Macromolecule capacitance type humidity sensing element.

The resistance temperature sensor (Pt100) is also used for heating the humidity sensing element in order to recover or detect each deterioration mode (see Table 3).

<Drift recovery function>

The temperature/humidity sensing element, FP4, vaporizes the residual chemicals in macromolecules by heating process in order to recover the drifted performance to its initial state.

The applicable chemicals for this function and resistances to them are described below.

- Continuous exposure concentrations

When 10 minutes heating process is carried out every 24 hours, the concentration and period in which the drifted value is recovered within ±2 % RH.

<table>
<thead>
<tr>
<th>Chemical</th>
<th>Specification</th>

</tbody>
</table>
< Drift detection function >

Since the humidity sensor's element needs to be exposed to the measurement atmosphere, it cannot be separated from the external environment. Therefore, a certain amount of drift cannot be avoided.

The main environment and deterioration modes that cause a drift are described below.

<table>
<thead>
<tr>
<th>Operation environment</th>
<th>Cause of drift</th>
<th>Deterioration modes</th>
<th>Detection function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manufactures of semiconductor, pharmacy, etc.</td>
<td>Organic solvents evaporated from the production material, adhesives, ink, etc.</td>
<td>Since the organic solvents infiltrate into the macromolecule and its conductivity changes, the measurement value will drift. Especially in a lower humidity environment (less than 30 % RH), the drift tends to large. According to the operating environment, it may deteriorate in a short period. The drift recovery function is effective.</td>
<td>Drift detection 1</td>
</tr>
<tr>
<td>Animal breeding facilities, hospitals, etc (open air, hot spring, etc.)</td>
<td>Salts contained in disinfectants, acids, sulfurous acid gas in the air</td>
<td>When the substance, adhering on the surface or nearby of element, absorbs moisture, the measurement value will drift. Especially in a higher temperature environment, the drift tends to large. It will take time to deteriorate. The drift will be recovered temporarily by the drift recovery function.</td>
<td>Drift detection 2</td>
</tr>
</tbody>
</table>

(Note) The drift may be recovered by cleaning the element. For details, refer to ■ Maintenance.

- **Drift detection 1**
  If organic solvents cannot be removed by the heating operation, the measurement value may drift. Although the relative humidity of the humidity element while heating is almost 0 %, if an organic solvent remains in a humidity element, it will become a high value. The measured humidity while heating is compared with the initial value (shipped from factory) to detect the drift. If it is detected, the error code E-30 is displayed.

  < How to detect drift detection 1 >
  (1) In the initial state of element (when it is shipped from factory or the element is replaced), the minimum humidity during heating operation is stored in the memory.
  (2) Compares the minimum humidity during heating operation with the value stored in the memory. The compared value can be checked in the maintenance mode No. 14-1, 14-2.
  (3) If the comparison result is larger than the preset value (drift error level), the error code E-30 is displayed. The drift error level can be set by the setting mode No. 8.

  (Note) If the dew point temperature of ambient during heating operation is 30 °C Td or more, the drift detection 1 cannot be detected. Error code E-31 is displayed.

- **Drift detection 2**
  When the deliquescent (hygroscopic) substance adheres on the surface or nearby of element, the measured humidity may drift higher. Although the deliquescent substance will not be removed by heating, the drift will be recovered temporarily since the moisture is evaporated. Therefore, the humidity measurement value of an element that was heated is compared with the value of another element to detect the drift.
< How to detect drift detection 2 >

(1) When the heating operation for the sensor 1 is completed, at the timing of switching the sensor from 2 to 1, the difference between sensor 1 and 2 is stored in the memory.

(2) When the heating operation for the sensor 2 is completed, at the timing of switching the sensor from 1 to 2, the difference between sensor 1 and 2 is stored in the memory.

The difference value can be checked in the maintenance mode No. 15.

(3) If both the stored differences are larger than the preset value (drift error level), the error code E-34 will be displayed.

Figure 31. Operation mode transition diagram (in the setting mode)
● Operation method

To prevent chattering, please press the keys firmly to operate them.

<table>
<thead>
<tr>
<th>Item</th>
<th>Operation method</th>
</tr>
</thead>
</table>
| Changing the settings (When settings are located on multiple rows) | (1) Specify Set No. or Subsection No. by pressing the [enter] key.  
(2) Change the set point (blinking at the lower row) by pressing the [Up] or [Down] key.  
Press and hold the key to accelerate changing of the value.  
(3) Press the [enter] key to enter the value. |
| Enabling setting change                        | Select Set No. 9 in the setting mode or Set No. 11 in the maintenance mode, and then change the set point to 1 (enabled) by pressing the [Up] or [Down] key.  
(Note) "– –" is not displayed at the row where the Subsection No. is located.  
When "– –" is displayed on the right side of the Set No., it means that setting change is disabled. |
| Keylock                                        | While the temperature is being displayed in the measurement mode, press the [enter] key for 2 seconds or more.  
(Note) When the keys are locked, all the indicators on the LCD light up for 1 second.  
When the keys are locked, if the keys other than [enter] key are pressed, "No." lights up for 1 second.  
When the keys are not accessed for 30 minutes, the keys will be locked. |
| Unlock the keys                                | While the keys are locked, press the [enter] key for 2 seconds or more.  
(Note) When the keys are unlocked, all the indicators on the LCD light up for 1 second. |
| Error cancellation (other than major failures) | While the error No. is displayed, press the [enter] key for 2 seconds or more.  
(Note) This operation is effective for the errors other than major failures.  
The errors will be canceled when causes of the errors are restored. |
| Changing mode                                  | Press the [mode] key.                                                                                                                                 |

● Mode operations

- When the set point is input or changed, press the [enter] key.  
The Set No. blinks and the input or changed set point becomes effective.  
- When no keys are accessed for 10 minutes, the screen will automatically switch to the screen on which the measurement values are displayed.  
In this case, humidity or dew point temperature is displayed according to the set point on the Set No. 1 of setting mode.  
- When the keys are not accessed for 30 minutes, the keys will be locked.

< Setting mode >

Parameters for measurement and calculation are displayed or set up.  
In order to change the settings for Set No. 1–8, set "1" (change enabled) to Set No. 9.

<sup>4</sup> Can change the setting by enabling No. 8 (ON).
<sup>5</sup> If the set point is changed to 0 (OFF), No. 8 and 9 can be changed.
<sup>6</sup> Displays the measurement value just when the [enter] key is pressed.
## Maintenance

**IMPORTANT** Maintenance work might be carried out in a chemical environment. In this case, check the chemicals used and take necessary measures according to the chemicals.
- Be careful so as not to pinch fingers while opening or closing the cover.
- Do not remove the cap other than replacing the element. The element might deteriorate by invasion of dust, etc.

This product is adjusted and inspected when it is shipped from the factory. No field adjustment is required. Do the product maintenance described below.

### Regular check

In order to maintain the accuracy of this product, do the following maintenance works.

#### < Drift detection >

1. Check that the drift detection 1 error (E-30) or the drift detection 2 error (E-34) has not occurred.
2. Check the amount of drifts for the humidity sensor 1 drift detection 1 (Set No. 14.1), humidity sensor 2 drift detection 1 (Set No. 14.2), and the drift value (Set No. 15) of humidity sensor 1 and 2.
3. If the amount of drifts is likely to exceed the drift error level before next inspection, execute the troubleshooting.

#### < Element service life >

1. Check that the element service life error (E-50) has not occurred.
2. Check the accumulated heating time ratio (Set No. 12).
3. If the accumulated heating time is likely to exceed the service life before next inspection, replace the sensor element.

#### < Cleaning >

When dust etc. have adhered to the sensor and the case, brush away the dust using a soft brush etc. Do not use a chemical cloth or detergent.

### Filter replacement

Replace the filter (P/N 83170626-001) periodically at the regular inspection, or when it becomes dirty with dust etc.

(1) Pull out the old filter from the filter cap and put a new one over it.

### On-site adjustment

Offset of temperature and humidity can be adjusted. If there are differences between the measurement value and the reference meter, adjust the offset. For details, refer to **Operations**.

1. Switch to the maintenance mode.
2. Select the humidity offset (Set No. 6) or temperature offset (Set No. 7) to set the offset value.

**Note**

1. Use a reliable measuring instrument as the reference meter.
2. When the offset was adjusted at the installed location, accuracy of the product is not guaranteed.

### Curing

When the product is installed in an animal breeding facility, an operating room, etc., and if the room is fumigated, take measures to cure the product. There are two methods to cure it.

- **Using a curing case**
  - Use a commercial curing case (recommended: SUGICO Co. P/N SH-25256). Push the case over the product to the wall. Close the gaps between the case and wall with curing tape.
  - Recommended size: 200×120×60 (W×H×D) or more

- **Using curing sheet**
  - Use bubble wrap (size: 400×300 (W×H)) as curing sheet to cover the product.
  - Stick the sheet over the product on the wall with curing tape so as not to make gaps around the product.
  - If the antiseptic solution is adhered on the case cover, chemical cracks may occur. So remove the curing case or sheet after the antiseptic solution is dried.

### Cautions for power restoration

1. The first heating after power restoration will start when the heating delay time elapses.
2. Correction between sensors is disabled. In order to execute measurements correctly, the heating processes must be applied to the sensor 1 and sensor 2 (random order) with the specified parameters.

For details, refer to **Functions**.
Troubleshooting

Error codes can be checked by pressing the [✓]/[✓] key.
The error codes from E-20 to E-34 can be canceled by pressing the [enter] key for 2 seconds or more while the error codes being displayed.
Also, if cause of the error is removed at the time of next error checking, the error will be canceled automatically.

(Note) When the keys are locked, press the [enter] key 2 seconds or more.
The keys will be unlocked.

</tbody>
</table>
When the accumulated heating time reaches 608 hours (calculated as 10 minutes/day for 10 years), the error will appear.

If the sensor heating process was done unsuccessfully, only the humidity measurement value is output as "error output" (5.6 V for 1–5 V, 22.4 mA for 4–20 mA). After displaying the error code for 1 minute, the measurement value of the measuring sensor that is not being heated is output. The heating operation is applied every heating cycle, if the insufficient heating is detected again, the error code will appear.

If the same error is reported to the connected controller every heating cycle, the error cannot be recovered by the sensor heating operation. Replace the element.

When the EEPROM file is error, the temperature and humidity measurement value is output as "error output" (0 V for 1–5 V, 0 mA for 4–20 mA).

Drift detection 1 (error code: E-30)
Effectiveness of "drift recovery function", which is useful for the drift caused by organic solvent, will decrease as time goes by. Finally, the amount of drift becomes large and an error will occur.

- Heat the element, and when it is stopped automatically, execute diagnosis for the drift value of element. When the error occurs, its error code will appear. When the error occurs, replace both the elements (x2) together.

  For details, refer to • Disposition when error occurs (Element replacement).

- If the error occurs in a short period (ex. within one year), it is suspected that the product was exposed to the atmosphere that exceeds the capability of the heating process.

- Extend the heating time (default: 10 minutes) or shorten the heating cycle (default: 12 hours).

However, be aware that the service life may become shorter by taking the action above.

(Note) Although the element is normal, the drift detection 1 occurs frequently, increase the drift error level (Set No. 8) in the setting mode.

Drift detection 2 (error code: E-34)
If the error occurs due to accumulation of deliquescent material on the element, clean the element. If no improvement is observed by cleaning, replace the element.

For details, refer to • Disposition when error occurs (Element cleaning).

Disposition when error occurs (Element cleaning)
If deliquescent material adheres to the surface of humidity sensor element, the humidity measurement value may drift and the drift detection 2 occurs. Clean the element with pure water to flush the accumulated material on the element, and then the drift value will decrease.

IMPORTANT
- Element cleaning does not always guarantee decreasing of drift. After cleaning the element, if the error occurs again, replace the element.
  - If the element is heated while it is wet, it may be damaged. Be sure to dry the element and then heat it.
  - If the element is cleaned excessively, it may be damaged. Maximum number of cleaning for the element is 10.
  - Be sure to attach the filter to the product. If the filter is not attached, the humidity-measuring element may fail within a short period of time.

< Element cleaning >
(1) Remove the element from the probe of the sensor to clean it with pure water. To clean the element, use a cleaning bottle to flush the electrode of element (marked by ○ in Fig. 35) with pure water.

(2) Hold and face the element as shown in Fig. 35.

(3) From slightly upper position to downward, jet pure water from the cleaning bottle for about 2 seconds to flush the contamination on the electrode of element.

(4) Redo the step (3) for 3–5 times.

(Note) There are connector pins as shown by the arrow in Fig. 36. Be careful not to jet water on the connector pins.
(5) Shake the element lightly to splash the water droplets. Then, dry the element naturally (25 °C 50 % RH) for 30 minutes to one hour. (6) Check that the element is dried. (7) Attach the element to the probe. (8) Execute the manual heating for the cleaned element by the sensor 1 manual heating (Set No. 2) or sensor 2 manual heating (Set No. 3). For details, refer to Element manual heating. (Note) While drying the element, keep it so as not to attach dust etc. to the element.

Disposition when error occurs (Element replacement)

**WARNING**
While [HEAT] lights up, do not touch the element. Doing so might cause burns because it is heated at 180 °C.

> IMPORTANT  ● Do not touch the electrode of element.

< Note for storing the spare element >
- Avoid a high temperature and humidity places.
- Store it in a place away from sunlight (ultraviolet rays).
- Do not apply excessive force.

< Note for replacing element >

> IMPORTANT  ● Be sure to attach the filter to the product. If the filter is not attached, the humidity-measuring element may fail within a short period of time.

- To replace the element, rotate the cap holding part where the filter is not attached. Failure to do so, the cap might be damaged. To attach the cap, screw it up with fingers without using a tool.
- Heating process cannot be carried out without the element attached.
- While replacing the element, no output is activated (0 V / 0 mA). No measurement is done.
- When the element is replaced, be sure to replace both the elements (x2) together.
- Just after replacement, measurement may not be carried out correctly. Wait until the element fits in the environment.

- After the element is replaced, the accumulated heating time and the accumulated heating time ratio become "0".
- When the error code E-30, E-34, E-60, or E-61 appears, or the element is faulty, replace the element.
- Be sure to replace the element in the ambient, dew point temperature is lower than 30 °C Td. When the dew point temperature is 30 °C Td or more, the initial value of the drift detection 1 cannot be measured correctly.

< Element replacement >

For details, refer to Operations.
(1) Prepare new elements (P/N 83170626-003) for replacement. (Note) Be sure to replace both the elements (x2) together for the sensor 1 and sensor 2.
(2) Switch to the maintenance mode. > [MNT] will light up.
(3) Enable the setting change; set "1: Enabled" to Set No. 11.
(4) Change the element replacement mode, Set No. 8, from 0 to 1. > Output prom the sensor will be disabled (0 V/0 mA).
(Note) Do not replace the element during the heating operation. The set point cannot be changed from "0."
(5) Remove the cap. Leave the filter attached on the cap.

(6) Remove the old elements from the sensor 1 and sensor 2. (Note) Check that the O-ring does not stay at A illustrated in Fig. 37. If the O-ring stay at there, remove it.
(7) Check that each of new element contains the O-ring, and attach the elements. At this time, check the number 1 or 2 printed on the element.
(8) Attach the cap.

(9) Select the element constant item (Set No. 9.1 to 9.6) in order, and set the constant 1 to 6 for the new elements.

(10) Select the element replacement heating (Set No. 10), and change the set point from 0 to 1.

> The heater turns on and [HEAT] lights up. Execute this heating process for both the elements.

> The heating process will automatically end in about 50 minutes.

> When the heating process ends, the sensor 1 is assigned for the measuring sensor and measurement will start. The next heating starts when the heating cycle time elapses after completion of the heating process.

< Element manual heating >

If the measurement value drifts since the element was exposed in high humidity, organic solvent, or chemical ambient, recover the drift by the manual heating process.

(Note) After the manual heating, the next heating starts when the heating cycle time elapses after the starting time of the heating process.

For details, refer to ■ Operations.

(1) Switch to the maintenance mode.

> [MNT] will light up.

(2) Enable the setting change; set "1: Enabled" to Set No. 11.

(3) Change the sensor 1 manual heating (Set No. 2) or sensor 2 manual heating (Set No. 3) from 0 to 1.

> The heating operation will be carried out for the amount of time specified in the setting mode, heating time (Set No. 5).

> When the specified time elapses, the heating will stop automatically.

(Note 1) If the heating has already started, the manual heating is not effective. Although the heating can be stopped manually, the sensor will be in the cooling down state. When the heating is stopped manually, the drift detection 1 is not carried out.

(Note 2) When the Heating Cycle Time automatic selection is enabled (ON), the heating time (Set No. 5) cannot be specified. Disable the setting (OFF) and specify the heating time. Specify the heating time approximately 10 minutes.

■ Disposal

Dispose of the product as industrial waste in accordance with your local regulations. Do not reuse all or part of this product.
