The flow calibration rig in Kyoto has the only two-stage elevated water tank system in Japan. At a height of 35m, the tanks are also the highest in Japan. It can run eight systems simultaneously, and its weighing system with maximum flow of 5,000m³/h makes this calibration rig the largest of its kind in Japan.
We offer a wide variety of flowmeters to meet your specific needs.

The flow rate is the most basic measurement in a process. A variety of methods of measuring the flow rate have been developed to cover a broad spectrum of fluid characteristics and measuring environments. We have released the following five types of flowmeters to provide longer operating life, good maintainability, and saving energy as customers require: electromagnetic, differential pressure, coriolis mass, thermal vortex, and thermal. From these, you can select the best for your specific needs.

**MagneW™ Two-wire PLUS+ Series**

**Smart Two-wire Electromagnetic Flowmeter**

**Model MTG**

**Features**

In the past, users had to make big sacrifices in functionality and performance to take advantage of two-wire simplicity, but this is no longer the case. The innovative design of the MTG18A delivers performance equal to current four-wire magnetic flowmeters. Azbil group released the world’s first two-wire loop powered magnetic flowmeter in 1992. Now we’ve taken the experience gained with the SMT3000 and developed the most innovative two-wire magnetic flowmeter on the market. Introducing the MagneW Two-wire PLUS+, delivering four-wire functionality with two-wire simplicity.

The major advantage of two-wire magnetic flowmeter technology is that it provides the end-user with a lower cost of ownership due to lower cost of flowmeter installation. Not only is the electrical installation more economical, but it can be simpler and easier to back up in the event of a power outage. In addition, replacement of existing two-wire and four-wire flowmeters can be implemented with little electrical work.
