Thank you for purchasing the MCF Air Flowmeter.

This manual contains information for ensuring the correct use of the MCF. It also provides necessary information for installation, maintenance, and troubleshooting.

This manual should be read by those who design and maintain equipment that uses the MCF. Be sure to keep this manual nearby for handy reference.

Azbil Corporation
If it is necessary to change the parameters of the MCF flowmeter frequently by communications, write the changes to RAM, not to EEPROM. EEPROM is limited to 10,000 erase/write cycles. Note that data in RAM is cleared and replaced with data from EEPROM if the power supply to the MCF is interrupted.

**NOTICE**

Be sure that the user receives this manual before the product is used.

Copying or duplicating this user’s manual in part or in whole is forbidden. The information and specifications in this manual are subject to change without notice.

Considerable effort has been made to ensure that this manual is free from inaccuracies and omissions. If you should find an error or omission, please contact the azbil Group.

In no event is Azbil Corporation liable to anyone for any indirect, special or consequential damages as a result of using this product.

Conventions Used in This Manual

■ To prevent injury to the operator and others, and to prevent property damage, the following types of safety precautions are indicated:

⚠️ WARNING  Warnings are indicated when mishandling this product might result in death or serious injury.

⚠️ CAUTION  Cautions are indicated when mishandling this product might result in minor injury to the user, or only physical damage to the product.

■ In describing the product, this manual uses the icons and conventions listed below.

⚠️ Use caution when handling the product.

⚠️ The indicated action is prohibited.

⚠️ Be sure to follow the indicated instructions.

⚠️ Handling Precautions:
Handling Precautions indicate items that the user should pay attention to when handling the MCF.

Books:  Notes indicate information that might benefit the user.

☞:  This indicates the item or page that the user is requested to refer to.

(1), (2), (3):  Numbers within parentheses indicate steps in a sequence or parts of an explanation.

>>>:  Indicates the result of an operation, details displayed on the personal computer or other devices, or the state of the device after operation.

ΩΩ  P-ΩΩ:  This indicates 7-segment indication on the setup display.

[MODE] key:  This indicates a key on the setup display.
## Safety Precautions

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Be sure to turn off the power supply when you connect the MCF. Failure to do so might cause malfunction.</strong></td>
</tr>
</tbody>
</table>
| **Do not disassemble the MCF.**  
**Doing so might cause malfunction.** |
| **Wire this device properly, according to the standards given in this document, using the specified types of wire and connection procedures. Failure to do so could result in malfunction.** |
| **Use this device within the operating ranges given in the specifications for temperature, humidity, voltage, vibration, shock, mounting direction, atmosphere, etc. Failure to do so might cause malfunction.** |
| **Do not allow wire clippings, metal shavings, water, etc. to enter the device’s case. If they do, they could cause faulty operation or device failure.** |
The Role of This Manual

A total of three different manuals are available for the MCF. Read them as necessary for your specific requirements. If a manual you require is not available, contact the azbil Group or its dealer.

MCF Air Flowmeter NPT Model User's Manual for Installation
Manual No. CP-UM-5573E
This manual is supplied with the device. Personnel in charge of design and/or manufacture of a system using this device must thoroughly read this manual. This manual describes the safety precautions, installation, wiring, list of parameters, and primary specifications.

MCF Air Flowmeter NPT Model User's Manual for Installation and Configuration
Manual No. CP-SP-1293E
The manual describes the hardware and all functions of this device. Personnel in charge of design, manufacture, operation, and/or maintenance of a system using this device must thoroughly read this manual. It describes installation, wiring, functions and settings, operating procedures, troubleshooting, and specifications.

MCF Air Flowmeter NPT Model User's Manual for Communication Functions
Manual No. CP-SP-1301E
This manual.
Those using the "communication functions" of the MCF series should read this manual.
This manual describes an outline of communications, wiring, communication procedures, a list of MCF series communication data, how to remedy trouble, and communication specifications.
Organization of This User's Manual

This manual is organized as follows:

Chapter 1. OVERVIEW
This chapter describes communication outline of the MCF series.

Chapter 2. WIRING
This chapter describes RS-485 wiring methods to make a communication link between the MCF series and other instruments.

Chapter 3. SETTING
This chapter describes MCF series communication settings.

Chapter 4. COMMUNICATION PROCEDURE
This chapter describes communication procedures, message configuration, data read/write and signal timing operations.

Chapter 5. COMMUNICATION DATA TABLE
This chapter provides various data address tables for communications on the MCF series.

Chapter 6. TROUBLESHOOTING
This chapter describes checkpoints to diagnose failures in MCF series communications.

Chapter 7. SPECIFICATIONS
This chapter lists communication specifications for the MCF series.

Appendix
The appendix provides code table.
5-2 Communication Data Table ............................................. 5-3
  ■ Device related data .................................................. 5-3
  ■ Operating status related data ..................................... 5-4
  ■ Instantaneous flow rate related data .......................... 5-5
  ■ Integrated flow rate related data ................................. 5-6
  ■ Function setup related data ....................................... 5-7
  ■ Parameter setup related data ..................................... 5-9
  ■ Maintenance mode .................................................... 5-10

Chapter 6. TROUBLESHOOTING ........................................... 6-1

  ■ RS-485 specifications ................................................. 7-1

Appendix
  Code table .................................................................. App-1
Chapter 1. OVERVIEW

The MCF series flowmeter (hereafter referred to as the MCF or the slave station) can communicate settings and data with a host device, such as a PC or PLC (also called the master station). Users write a customized communication program for this purpose.

■ Features

The MCF has the following communications features.
• Remote data collection and parameter setting by RS-485 communications.
• Support for Modbus communications protocol (ASCII/RTU mode).
• With RS-485 communications, up to 31 slave stations can be connected to the master station, which can read instantaneous flow rate and total flow values and various settings from slave stations, and can also write settings to slave stations using the user’s own communications program.
• Uses “station addresses” for RS-485 communications to identify connected
• When the following procedure is completed during communication, various data for the controller can be read or written:
  (1) The master station transmits a request message to the slave station.
  (2) The master station receives a response message from the slave station.
• The commands from master station to slave station are classified into two types: read and write.
• The type of read/write data can be selected by data address.

■ Hardware configuration 1

![Diagram of hardware configuration 1]
Hardware configuration 2

- Master station
- LAN (Ethernet)
- MODBUS converter (gateway)
- RS-485 (3-wire system)
- Slave station (MCF)
- Max. 31 units
Chapter 2.  WIRING

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>!</td>
</tr>
<tr>
<td>!</td>
</tr>
<tr>
<td>!</td>
</tr>
<tr>
<td>!</td>
</tr>
</tbody>
</table>
An example of connection methods is shown below.

### Connection with 3-wire system

![Diagram](image)

#### Handling Precautions

- Connect terminating resistors of 150 Ω ± 5%, 1/2W or more to both ends of the communication path.
- Ground the shield of shielded cable to the frame ground (FG) at one end. Do not ground the shield at both ends.
- Azbil Corporation’s CMC10L001A000 controller can be used as a converter for the master station.
- Be sure to connect the SG terminals to each other. Failure to do so might cause unstable communications.
### Connection with 5-wire system

![Diagram of 5-wire system connection]

#### Handling Precautions

- Connect terminating resistors of $150 \, \Omega \pm 5\%$, 1/2W or more to both ends of the communication path.
- Ground the shield of shielded cable to the frame ground (FG) at one end. Do not ground the shield at both ends.
- Azbil Corporation’s CMC10L001A000 controller can be used as a converter for the master station.
- Be sure to connect the SG terminals to each other. Failure to do so might cause unstable communications.
Chapter 3. SETTING

Before starting communication, set the communication condition and station address of the slave station to meet that of the master station.

■ Setting method

Before starting RS-485 communications, follow the procedure below to set the MCF’s communication parameters and station address so that they are compatible with the master station.

(1) Push and hold the [mode] key for 2 seconds or more in the normal indication mode.
   >> The function number is displayed in the first 3 digits and the current setting is displayed in the last 2 digits.

(2) Change the function setup to the desired item by pushing [ ] or [ ], and then press [enter].
   >> The function setup number goes out, and the only the setting (in the last 2 digits) is shown.

(3) Change the setting with the [ ] or [ ] key, and then press [enter].
   >> The changed setting is now entered, and both the function number and the setting are shown.
   If the [mode] key is pressed instead of the [enter] key, the MCF exits setup mode without changing the setting.

(4) Repeat steps (2) to (3) if you want to continue setup.

To exit setup mode, press and hold the [mode] key for 2 seconds or more to move to parameter setup, and then again press and hold the [mode] key for 2 seconds or more to return to normal indication mode.
Function settings

<table>

</tbody>
</table>

Handling Precautions

- About the default station address setting
  The default station address setting is 00. However, this address cannot be used because broadcasting is not supported. Instead, when first setting up the MCF, the special station address 247 can be used. Using the settings Modbus RTU, 8-bit data, even parity, 1 stop bit (RTU), and 9600 bps, and using the station address 247, do as follows.
- Set EEPROM address 5030 (station address) to a unique address, not used by other slave stations.
- Send “1” to address 2034 (power reset command) to reset the power of the MCF. Before doing so, be sure to turn off the power of any other slave stations whose station address is set to 00, so as not to affect them.
Chapter 4. COMMUNICATION PROCEDURE

4 - 1 Outline of Communication Procedure and Messages

This chapter describes the outline of communication procedure and the concept behind message configuration.

Communication procedure

The following is a simple breakdown of the communication procedure:

(1) The master station transmits an instruction message to a slave station to specify a station for communication.

(2) The slave station processes the instruction message, and executes read and write operations.

(3) The slave station transmits a response message according to the contents of processing.

(4) The master station receives the response message and executes processing.

Supported communication types and function codes

(1) Transmission Modes

Supports Modbus ASCII and Modbus RTU.

<table>
<thead>
<tr>
<th>Coding System</th>
<th>RTU format</th>
<th>ASCII format</th>
</tr>
</thead>
<tbody>
<tr>
<td>System</td>
<td>8 bit binary</td>
<td>ASCII characters: 0–9, A–F</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Bits per Bits</th>
<th>System</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>8-bit data, even parity, 1 stop bit. The MCF is also compatible with 8-bit data, no parity, 2 stop bits.</td>
<td>CRC (Cyclic Redundancy Checking)</td>
<td>7-bit data, even parity, 1 stop bit. The MCF is also compatible with 7-bit data, no parity, 2 stop bits.</td>
</tr>
</tbody>
</table>

(2) Function Codes

Supports the following Modbus public function codes.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x03</td>
<td>Read Holding Registers (read multiple words)</td>
</tr>
<tr>
<td>0x06</td>
<td>Write Single Register (write 1 word)</td>
</tr>
<tr>
<td>0x10</td>
<td>Write Multiple Registers (write multiple words)</td>
</tr>
</tbody>
</table>

Station address

Range: 0 to 99.

If the station address is set to 0, communications are not possible. To enable communications, set the station address at a value from 1 to 99. (In the Modbus communications protocol, if the station address of a device that is processing a command is set to 0, broadcasting activates the device. However, the MCF does not support broadcasting.)

Maximum number of words

Read: 16 data
Write: 16 data

Modbus communications frame

The communications frame varies depending on the mode.
**RTU**

(1) Communications frames
All messages are written in binary data.

**RTU communications frame**

<table>
<thead>
<tr>
<th>Frame structure</th>
<th>Number of bytes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start &gt; 3.5 characters</td>
<td>0</td>
<td>Silent interval</td>
</tr>
<tr>
<td>Address</td>
<td>1</td>
<td>Station address</td>
</tr>
<tr>
<td>Function</td>
<td>1</td>
<td>Refer to function code descriptions.</td>
</tr>
<tr>
<td>Data</td>
<td>n*</td>
<td>Refer to function code descriptions.</td>
</tr>
<tr>
<td>CRC Check code</td>
<td>2</td>
<td>Check code</td>
</tr>
<tr>
<td>End &gt; 3.5 characters</td>
<td>0</td>
<td>Silent interval</td>
</tr>
</tbody>
</table>

*1 byte or more.

(2) Silent interval
In RTU mode in Modbus communications protocol, the start and end of commands and responses must be marked by a time without data transmission that is equivalent in duration to at least 3.5 characters (the time varying depending on the baud rate).
The **MCF** checks for a silent interval with a timer interrupt every 200 µs.
Silent intervals are illustrated below.

**Silent interval times**

<table>
<thead>
<tr>
<th>Transmission speed</th>
<th>MCF silent interval</th>
<th>Time equivalent of 3.5 characters (8-bit data)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>With parity, 1 stop bit (11 bit)</td>
</tr>
<tr>
<td>4800 bps</td>
<td>7.8 to 8 ms</td>
<td>8.0 ms</td>
</tr>
<tr>
<td>9600 bps</td>
<td>3.8 to 4 ms</td>
<td>4.0 ms</td>
</tr>
<tr>
<td>19200 bps</td>
<td>1.8 to 2 ms</td>
<td>2.0 ms</td>
</tr>
</tbody>
</table>

(3) Check code
In Modbus RTU mode, a CRC check code is applied to both commands and responses.

- **Calculation of CRC check code**
  Calculation of the check code is based on the section from the station address until just before the check code location in the message. (All 8-bit character data is included, but not start bits, stop bits, or parity bits.) The binary data in the message is used in the calculation without any conversion.
The **CRC check code** (16-bit data) can be calculated by the C language function `get_crc16()`.
In the message, the low byte precedes the high byte in the CRC check code. This is the opposite of the treatment of other 16-bit data.
/* ***********************************************************************
 Argument 1: Length of character string (number of bytes)
 Argument 2: Pointer to beginning of character string
 Function value: Calculation result
 ************************************************************************/

UH get_crc16(INT len, UB *p)
{
    UH dt_16;
    UH next;
    UH carry;
    INT i;

    dt_16 = 0xffff;
    while (len > 0) {
        next = (UH)*p;
        dt_16 ^= next;
        for (i = 0; i < 8; i++) {
            carry = (UH)(dt_16 & 0x0001);
            dt_16 >>= 1;
            if (carry != 0) {
                dt_16 ^= 0xA001;
            }
        }
        p++;
        len--;
    }
    return dt_16;
}

(4) Example of communications frame
Contents: station address (1), function (03), initial word (2001 [decimal]),
number of words to read (1).

<table>
<thead>
<tr>
<th>01 01H</th>
<th>Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>03 03H</td>
<td>Function</td>
</tr>
<tr>
<td>07 07H</td>
<td>Word1, 1st byte</td>
</tr>
<tr>
<td>D1 D1H</td>
<td>Word1, 2nd byte</td>
</tr>
<tr>
<td>00 00H</td>
<td>Word2, 1st byte</td>
</tr>
<tr>
<td>01 01H</td>
<td>Word2, 2nd byte</td>
</tr>
<tr>
<td>D5 D5H</td>
<td>CRC 1, 1st byte</td>
</tr>
<tr>
<td>47 47H</td>
<td>CRC 2, 2nd byte</td>
</tr>
</tbody>
</table>

• Calculation of CRC code

(1) The check code calculation is based on the section of the message from the station
address until just before the check code, and therefore includes “01 03 07D1 00 01.” In this case the result of the calculation is 47D5H.
For the method of calculation, see (3) “Check code” above.

(2) When the result of the calculation, 47D5H, is added to the message, its order is
changed so that the low byte precedes the high byte: D547H.
(1) Communications frame
The whole message except for delimiters is written with hexadecimal ASCII codes. The frame differs depending on the communications type.

Note: the MCF accepts only capital letters.

ASCII commands and responses

<table>
<thead>
<tr>
<th>Frame structure</th>
<th>Number of characters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start</td>
<td>1 char</td>
<td>‘:’ (3AH). This symbol cannot be changed.</td>
</tr>
<tr>
<td>Address</td>
<td>2 chars</td>
<td>Station address (hexadecimal ASCII)</td>
</tr>
<tr>
<td>Function</td>
<td>2 chars</td>
<td>Refer to function code descriptions (hexadecimal ASCII)</td>
</tr>
<tr>
<td>Data</td>
<td>n-chars</td>
<td>Refer to function code descriptions (hexadecimal ASCII)</td>
</tr>
<tr>
<td>LRC</td>
<td>2 chars</td>
<td>LRC (Check code)</td>
</tr>
<tr>
<td>CR</td>
<td>1 char</td>
<td>Delimiter CR (0DH)</td>
</tr>
<tr>
<td>LF</td>
<td>1 char</td>
<td>Delimiter LF (0AH)</td>
</tr>
</tbody>
</table>

Note: A character (char) = 2 bytes.

(2) Check code
In Modbus ASCII, an LRC code is used for both commands and responses.

- Calculation of LRC check code
  Calculation of the check code is based on the section from the station address until just before the check code location in the message. In order to compute the check code, first convert the pairs of hexadecimal ASCII characters in the message to binary data. Sum up all of the target data as an 8-bit number without a carry bit. Then convert the two's complement of the calculated (8-bit) value to 2 hexadecimal ASCII characters. This is the check code. In the message, the high byte precedes the low byte.
  If a received message has an odd number of bytes, a check code error will occur. No response will be sent because the LRC check code could not be calculated.
(3) Sample frame

<table>
<thead>
<tr>
<th></th>
<th></th>
<th>Start</th>
</tr>
</thead>
<tbody>
<tr>
<td>`.'</td>
<td>3AH</td>
<td></td>
</tr>
<tr>
<td><code>0</code></td>
<td>30H</td>
<td>Address 1st byte</td>
</tr>
<tr>
<td><code>A</code></td>
<td>41H</td>
<td>Address 2nd byte</td>
</tr>
<tr>
<td><code>0</code></td>
<td>03H</td>
<td>Function 1st byte</td>
</tr>
<tr>
<td><code>3</code></td>
<td>33H</td>
<td>Function 2nd byte</td>
</tr>
<tr>
<td><code>0</code></td>
<td>30H</td>
<td>Word1 1st byte</td>
</tr>
<tr>
<td><code>3</code></td>
<td>30H</td>
<td>Word1 2nd byte</td>
</tr>
<tr>
<td><code>E</code></td>
<td>45H</td>
<td>Word1 3rd byte</td>
</tr>
<tr>
<td><code>9</code></td>
<td>39H</td>
<td>Word1 4th byte</td>
</tr>
<tr>
<td><code>0</code></td>
<td>30H</td>
<td>Word2 1st byte</td>
</tr>
<tr>
<td><code>0</code></td>
<td>30H</td>
<td>Word2 2nd byte</td>
</tr>
<tr>
<td><code>0</code></td>
<td>30H</td>
<td>Word2 3rd byte</td>
</tr>
<tr>
<td><code>2</code></td>
<td>32H</td>
<td>Word2 4th byte</td>
</tr>
<tr>
<td><code>0</code></td>
<td>30H</td>
<td>LRC 1st byte</td>
</tr>
<tr>
<td><code>5</code></td>
<td>35H</td>
<td>LRC 2nd byte</td>
</tr>
<tr>
<td>CF</td>
<td>ODH</td>
<td></td>
</tr>
<tr>
<td>LF</td>
<td>0AH</td>
<td></td>
</tr>
</tbody>
</table>

**Sample LRC (check code) calculation**

(1) Sum up all the bytes from the beginning of the station address until just before the check code location.

\[
0AH + 03H + 03H + E9H + 00H + 02H = FBH
\]

(2) The low-order byte of FBH is FBH (no change). The two's complement of FBH is 05H.

(3) Convert 05H to a 2-byte ASCII code.

0: 30H
5: 35H

Therefore, 30H and 35H are the check code.
Abnormal termination codes

In keeping with the Modbus protocol, when an error occurs there is a response to the error. The same set of error responses is used for all the function codes. The tables below show the responses to error for RTU and ASCII modes.

RTU mode responses to error

<table>

</tbody>
</table>
Conditions under which no response message is sent

The MCF sends no response messages under the following conditions:

- When it receives a message during initialization (the first 8 seconds or so after power-on).
- When an LRC or CRC error occurs.
- When the data size of a received message exceeds 100 bytes (overflow).
- If a message is received between the time when another received message ends and the sending of the response message ends.
- In ASCII mode, when characters other than colon (:) and 1-9, and capital A-F are received.
Chapter 4. COMMUNICATION PROCEDURE

4 - 2 Command

Function 0x03 (Read multiple words command)

Function 0x03, Read holding registers, is the command for reading multiple words.

(1) RTU mode

Commands and responses are shown in the table below.

Refer to “RTU mode responses to error” above.

(4) Address of first word.  (5) Number of words to write.  (6) LRC  (7) Delimiter.
4 - 3 Timing Specifications

Timing specifications for instruction and response messages

The following precautions regarding the transmission timing of instruction messages from the master station and response messages from the slave station should be observed:

- **Response time-out**

  The maximum response time from the end of the instruction message transmission by the master station until when the master station receives a response message from the slave station is 2 seconds ((1) in figure). So, the response time-out should be set to 2 seconds.

  Generally, when a response time-out occurs, the instruction message is resent.

- **Transmission start time**

  ![Timing diagram](image)

  (1) End of master station transmission - Transmission start time of slave station = 2 s max.

  (For the master station, the response time-out after the end of instruction message transmission should be set to 2 s.)

  (2) End of slave station transmission - Transmission start time of master station = 10 ms min.

  (For the master station, stand by for 10 ms or more from the end of response message receipt to the start time of next transmission.)

RS-485 driver control timing specifications

When the transmission/reception on the RS-485 3-wire system is directly controlled by the master station, care should be paid to the following timing:

![Timing diagram](image)

(1) End of master station transmission - Driver disable time = 500 $\mu$s max.

(2) End of slave station reception - Driver enable time = 8 ms min.

(3) End of slave station transmission - Driver disable time = 10 ms max.

(4) End of master station reception - Driver enable time = 10 ms min.

- The time required for the master station to finish the transmittal of instruction message and for the slave station to start the transmittal of response message becomes longer if the number of data to write and read increases.

  When the faster response time is required by the slave station, make sure to keep the number of data to read / write at the minimum in one message.
Chapter 5. COMMUNICATION DATA TABLE

5 - 1 Basic Communication Data Processing

■ Communication data types and formats
  ● Types of communication data
    The communications data are categorized as follow:
    • Device related data
    • Operating status related data
    • Instantaneous flow rate related data
    • Integrated flow related data
    • Function setup related data
    • Parameter setup related data

  ● Format of communication data
    Communication data is classified into the following formats:
    • Numeric data: Data indicating a numeric value (instantaneous flow rate, etc.).
    • Bit data: Data where each bit is significant (alarms, etc.). Bit data must be composed by transmission and decomposed by reception.

If it is necessary to change the parameters of the MCF series frequently by communication, write data at addresses of RAM. The endurance of EEPROM is limited to 100,000 erase/write cycles. Note that the data in RAM is cleared, and is replaced with the data in EEPROM if the power supply to the MCF series is interrupted.

■ Communication data storage memory
  ● Memory type
    The communication data are stored in the following two types of memory:
    • RAM: Stored data is cleared when the power is turned OFF. However data can be written to this memory infinitely.
    • EEPROM: Stored data is retained even when the power is turned OFF, whereas data erase/write cycles are limited to a total of 100,000 times owing to device characteristics.

  ● Communication object memory
    In communication, it is necessary to read/write data from/into the abovementioned two types of memory according to the purpose and use. There is a difference between the object memories as follows:
    • RAM: Data is read/written from/into RAM only. If the power supply is turned off after writing data into RAM, and then it is turned on again, the data in EEPROM is copied on RAM, so the data in RAM becomes the same as in EEPROM.
    • EEPROM: Data are written in both RAM and EEPROM.
Chapter 5. COMMUNICATION DATA TABLE

■ Data address

The data addresses are allocated as shown in the table below.

<table>
<thead>
<tr>
<th>Communication data</th>
<th>Offset value decimal number</th>
<th>Address decimal number</th>
<th>Offset value decimal number</th>
<th>Address decimal number</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device related data</td>
<td>1000 (03E8)</td>
<td>1001 to 1199 (03E9 to 04AF)</td>
<td>4000 (0FA0)</td>
<td>4001 to 4199 (0FA1 to 1067)</td>
</tr>
<tr>
<td>Operating status related data</td>
<td>1200 (04B0)</td>
<td>1201 to 1399 (04B1 to 0577)</td>
<td>4200 (1068)</td>
<td>4201 to 4399 (1069 to 112F)</td>
</tr>
<tr>
<td>Instantaneous flow rate related data</td>
<td>1400 (0578)</td>
<td>1401 to 1599 (0579 to 063F)</td>
<td>4400 (1130)</td>
<td>4401 to 4599 (1131 to 11F7)</td>
</tr>
<tr>
<td>Integrated flow rate related data</td>
<td>1600 (0640)</td>
<td>1601 to 1799 (0641 to 0707)</td>
<td>4600 (11F8)</td>
<td>4601 to 4799 (11F9 to 12BF)</td>
</tr>
<tr>
<td>Function setup related data</td>
<td>2000 (07D0)</td>
<td>2001 to 2199 (07D1 to 0897)</td>
<td>5000 (1388)</td>
<td>5001 to 5199 (1389 to 144F)</td>
</tr>
<tr>
<td>Parameter setup related data</td>
<td>2200 (0898)</td>
<td>2201 to 2399 (0899 to 095F)</td>
<td>5200 (1450)</td>
<td>5201 to 5399 (1451 to 1517)</td>
</tr>
<tr>
<td>Maintenance mode related data</td>
<td>2800 (0AF0)</td>
<td>2801 to 2999 (0AF1 to 0BB7)</td>
<td>5800 (16A8)</td>
<td>5801 to 5999 (16A9 to 176F)</td>
</tr>
</tbody>
</table>

■ Number of data read / write

The number of data which can be continuously read/written by once communication is as shown in the table below.

<table>
<thead>
<tr>
<th></th>
<th>RAM</th>
<th>EEPROM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read</td>
<td>16</td>
<td>16</td>
</tr>
<tr>
<td>Write</td>
<td>16</td>
<td>16</td>
</tr>
</tbody>
</table>

■ Data unit and decimal point position

Read/write data is not appended with a decimal point. The unit and decimal point position is determined for each data item. For details on the data unit and decimal point position, see the MCF series User's Manual.
## 5 - 2 Communication Data Table

The enabling conditions for the address and R/W (Read/Write) of each data are specified in the following table:

The meaning of R/W column marks:

○ : R/W (Read/Write) possible
× : R/W (Read/Write) impossible (An error code is returned.)

If an undefined address is accessed, an error code is returned.

<tr>
<td>8〜15</td>
<td>Undefined (normally 0)</td>
</tr>
</tbody>
</table>

- Bits No. 1 to 4 indicate the decimal point positions for the instantaneous flow rate. If all of them are set to 0, there is no decimal point.

*2: Instantaneous flow rate

Displays the instantaneous flow rate value used for flow rate output. The decimal point is determined by one of decimal point flags of bits 0 to 4 in the instantaneous flow rate status (address 1402). For example, if the read value of instantaneous flow rate is “xxxx” H (decimal: 1234) and bit 2 of Instantaneous flow rate status is ON, the displayed instantaneous flow rate is calculated as $1234 \times 10^{-2} = 12.34$.

The flow rate unit used is the one selected at address 2002.

<td>○</td>
<td>4631</td>
<td>-</td>
<td>Writing “1” resets the total flow value, total backflow value, and cost displays to 0. When data is read, 0 is always read out. If any other value is input, there is no response.</td>
</tr>
<tr>
<td>Permission for rewriting total flow value</td>
<td>0 to 65535</td>
<td>1632</td>
<td>○</td>
<td>---</td>
<td>--</td>
<td>If “1” is input, writing total flow values (1601, 1602) and total backflow values (1605, 1606) is allowed. If any other value is input, changing the settings is not allowed.</td>
</tr>
</tbody>
</table>

*1: Processing of total flow high- and low-order data
To read each total flow value, use 1 command, namely the command for reading continuous words. After read-out of the data, do the following calculation: (High value × 65536) + Low value.
Example: If the total flow high-order value is 000A (decimal: 10) and the low-order value is 1B3A (decimal: 6970), the calculation is done as follows: (10 × 65536) + 6970 = 662330

*2: Decimal point position for total flow
The table below shows that the decimal point position varies depending on the value read.

<table>
<thead>
<tr>

</tbody>
</table>
Chapter 6. **TROUBLESHOOTING**

Check items in case communication is disabled

1. Check the power supply.

2. Check the wiring.

3. Check if the communication conditions for the MCF series meet those for the host computer.
   - If any one of the following setting items is different between both stations, communication is disabled:
     - The underlined items mean that they can be set on the MCF series side.
     - Transmission speed: 4800, 9600, 19200 bps

   **Communication parameters:**

<table>
<thead>
<tr>
<th>Available settings</th>
<th>ASCII</th>
<th>RTU</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data length: 8 data bits, 1 stop bit, even parity</td>
<td>✗</td>
<td>✓</td>
</tr>
<tr>
<td>Data length: 8 data bits, 2 stop bits, no parity</td>
<td>✗</td>
<td>✓</td>
</tr>
<tr>
<td>Data length: 7 data bits, 1 stop bit, even parity</td>
<td>✓</td>
<td>✗</td>
</tr>
<tr>
<td>Data length: 7 data bits, 2 stop bits, no parity</td>
<td>✓</td>
<td>✗</td>
</tr>
</tbody>
</table>

   “✗” means that communication is not possible.

4. Does the communication timing conform to the specifications in section 4-3, Timing Specifications (page 4-14)?
5. Check if the destination address of the command frame transmitted from the host computer meets the address set to the MCF series.
   - The address of the MCF series set to “0” for factory setting.
   - Even when the destination address of the command frame is set to 00 (30H, 30H), the MCF series does not respond to such a message.

6. Are those multi-dropped MCF series being operated themselves with different station address setups?
# Chapter 7. SPECIFICATIONS

</thead>
</table>
**Terms and Conditions**

We would like to express our appreciation for your purchase and use of Azbil Corporation's products.

You are required to acknowledge and agree upon the following terms and conditions for your purchase of Azbil Corporation's products (field instruments, control valves, and control products), unless otherwise stated in any separate document, including, without limitation, estimation sheets, written agreements, catalogs, specifications and instruction manuals.

1. Warranty period and warranty scope
   1.1 Warranty period
   Azbil Corporation's products shall be warranted for one (1) year from the date of your purchase of the said products or the delivery of the said products to a place designated by you.

   1.2 Warranty scope
   In the event that Azbil Corporation's products has any failure attributable to azbil during the aforementioned warranty period, azbil shall, without charge, deliver a replacement for the said product to the place where you purchased, or repair the said product and deliver it to the aforementioned place.

   Notwithstanding the foregoing, any failure falling under one of the following shall not be covered under this warranty:
   1) Failure caused by your improper use of Azbil Corporation's products
      (noncompliance with conditions, environment of use, precautions, etc. set forth in catalogs, specifications, instruction manuals, etc.);
   2) Failure caused for other reasons than Azbil Corporation's products;
   3) Failure caused by any modification or repair made by any person other than azbil or azbil's subcontractors;
   4) Failure caused by your use of Azbil Corporation's products in a manner not conforming to the intended usage of that product;
   5) Failure that the state-of-the-art at the time of Azbil Corporation's shipment did not allow us to predict; or
   6) Failure that arose from any reason not attributable to Azbil Corporation, including, without limitation, acts of God, disasters, and actions taken by a third party.

   Please note that the term "warranty" as used herein refers to equipment-only-warranty, and Azbil Corporation shall not be liable for any damages, including direct, indirect, special, incidental or consequential damages in connection with or arising out of Azbil Corporation's products.

2. Ascertainment of suitability
   You are required to ascertain the suitability of Azbil Corporation's products in case of your use of the same with your machinery, equipment, etc. (hereinafter referred to as "Equipment") on your own responsibility, taking the following matters into consideration:
   1) Regulations and standards or laws that your Equipment is to comply with.
   2) Examples of application described in any documents provided by Azbil Corporation are for your reference purpose only, and you are required to check the functions and safety of your Equipment prior to your use.
   3) Measures to be taken to secure the required level of the reliability and safety of your Equipment in your use.

   Although Azbil Corporation is constantly making efforts to improve the quality and reliability of Azbil Corporation's products, there exists a possibility that parts and machinery may break down. You are required to provide your Equipment with fool-proof design, fail-safe design, anti-flame propagation design, safety design, or the like so that the said Equipment may satisfy the level of the reliability and safety required in your use, whereby preventing any occurrence of physical injuries, fires, significant damage, and so forth.

3. Precautions and restrictions on application
   Azbil Corporation's products other than those explicitly specified as applicable (e.g. azbil Limit Switch For Nuclear Energy) shall not be used in a nuclear energy controlled area (radiation controlled area). Any Azbil Corporation's products shall not be used for/with medical equipment.

   In addition, you are required to conduct a consultation with our sales representative and understand detail specifications, cautions for operation, and so forth by reference to catalogs, specifications, instruction manual, etc. in case that you intend to use Azbil Corporation's products for any purposes specified in (1) through (6) below.

   Moreover, you are required to provide your Equipment with fool-proof design, fail-safe design, anti-flame propagation design and other designs of protection/safety circuit on your own responsibility to ensure the reliability and safety, whereby preventing problems caused by failure or nonconformity.
   1) For use under such conditions or in such environments as not stated in technical documents, including catalogs, specification, and instruction manuals
   2) For use of specific purposes, such as:
      * Nuclear energy/radiation related facilities
      * Machinery or equipment for space/sea bottom
      * Transportation equipment
      * Antidisaster/crime-prevention equipment
      * Burning appliances
      * Electrothermal equipment
      * Amusement facilities
   3) Supply systems such as electricity/gas/water supply systems, large-scale communication systems, and traffic/air traffic control systems requiring high reliability
   4) Facilities that are to comply with regulations of governmental/public agencies or specific industries
   5) Machinery or equipment that may affect human lives, human bodies or properties
   6) Other machinery or equipment equivalent to those set forth in items (1) to (5) above which require high reliability and safety
4. Precautions against long-term use
   Use of Azbil Corporation's products, including switches, which contain electronic components, over a prolonged period may degrade insulation or increase contact-resistance and may result in heat generation or any other similar problem causing such product or switch to develop safety hazards such as smoking, ignition, and electrification.
   Although acceleration of the above situation varies depending on the conditions or environment of use of the products, you are required not to use any Azbil Corporation's products for a period exceeding ten (10) years unless otherwise stated in specifications or instruction manuals.

5. Recommendation for renewal
   Mechanical components, such as relays and switches, used for Azbil Corporation's products will reach the end of their life due to wear by repetitious open/close operations.
   In addition, electronic components such as electrolytic capacitors will reach the end of their life due to aged deterioration based on the conditions or environment in which such electronic components are used.
   Although acceleration of the above situation varies depending on the conditions or environment of use, the number of open/close operations of relays, etc.
   as prescribed in specifications or instruction manuals, or depending on the design margin of your machine or equipment, you are required to renew any Azbil Corporation's products every 5 to 10 years unless otherwise specified in specifications or instruction manuals.
   Field instruments (sensors such as pressure/flow/level sensors, regulating valves, etc.) will reach the end of their life due to aged deterioration of parts.
   For those parts that will reach the end of their life due to aged deterioration, recommended replacement cycles are prescribed. You are required to replace parts based on such recommended replacement cycles.

6. Other precautions
   Prior to your use of Azbil Corporation's products, you are required to understand and comply with specifications (e.g., conditions and environment of use), precautions, warnings/cautions/notices as set forth in the technical documents prepared for individual Azbil Corporation's products, such as catalogs, specifications, and instruction manuals to ensure the quality, reliability, and safety of those products.

7. Changes to specifications
   Please note that the descriptions contained in any documents provided by Azbil Corporation are subject to change without notice for improvement or for any other reason.
   For inquiries or information on specifications as you may need to check, please contact our branch offices or sales offices, or your local sales agents.

8. Discontinuance of the supply of products/parts
   Please note that the production of any Azbil Corporation's products may be discontinued without notice.
   For repairable products, we will, in principle, undertake repairs for five (5) years after the discontinuance of those products. In some cases, however, we cannot undertake such repairs for reasons, such as the absence of repair parts.
   For field instruments, we may not be able to undertake parts replacement for similar reasons.
