Thank you for purchasing an Azbil Corporation product. This manual contains information for ensuring the correct use of this product. This manual should be read by those who design and maintain equipment that uses this product. Be sure to keep this manual nearby for handy reference.

Please read “Terms and Conditions” from the following URL before ordering and use. http://www.azbil.com/products/factory/order.html

**NOTICE**

Be sure that the user receives this manual before the product is used.

Copying or duplicating this user’s manual in part or in whole is forbidden. The information and specifications in this manual are subject to change without notice.

Considerable effort has been made to ensure that this manual is free from inaccuracies and omissions. If you should find an error or omission, please contact the azbil Group.

In no event is Azbil Corporation liable to anyone for any indirect, special or consequential damages as a result of using this product.

© 2014–2018 Azbil Corporation All Rights Reserved.

**SAFETY PRECAUTIONS**

Safety precautions are for ensuring safe and correct use of this product, and for preventing injury to the operator and other people or damage to property. You must observe these safety precautions. Also, be sure to read and understand the contents of this user’s manual.

**Key to symbols**

- **WARNING**
  - Warnings are indicated when mishandling this product might result in death or serious injury to the user.

- **CAUTION**
  - Cautions are indicated when mishandling this product might result in minor injury to the user, or only physical damage to this product.

**WARNING**

Before installing, removing, or wiring this product, be sure to shut off the power and gas. Otherwise, an electric shock or gas leak may result.

The installation, wiring, adjustment, inspection, and maintenance of this product should be carried out only by specialists with sufficient knowledge and technical skill concerning combustion and industrial furnaces.

After piping and wiring, be sure to check for gas leaks before introducing gas into the piping. Failure to do so may cause fire or device failure.

Do not repair, modify, or disassemble this product. Otherwise, an electric shock or gas leak may result. Be sure to obtain genuine Azbil Corporation parts for replacement use and when purchasing separately sold accessories.

Because the solenoid coil can reach high temperatures, do not touch it when the product is operating.

Before use, carry out a trial run to check the operation of this product, and make any necessary adjustments.

If dust enters this product, it may not shut off gas properly, resulting in a serious accident. Flush the piping with air before installing this product. In addition, install a filter on the upstream side of the product.

This product has a limited lifetime. Replace it before the end of its service life is reached. If this product is used beyond its service life, a serious accident such as a gas leak may result.

If LPG is used, install a mist trap in order to prevent liquefied gas components (adhesive material) from entering this product.

**CAUTION**

Use this product only for natural gas, LPG (propane, butane), or air. If it is used for some other gas, metal and rubber parts will be corroded or deteriorated, causing a gas leak or device failure.

In compliance with gas combustion equipment standards and guidelines, use two valves in series for redundant shutdown.

To prevent an electric shock, keep the cover of the terminal box closed during operation.

Do not install where this product will be exposed to any of the following:

- Certain chemicals or corrosive gases (ammonia, sulfur, chlorine, ethylene compounds, acid, etc.).
- Splashing water or excessive humidity
- High temperatures
- Prolonged vibration

Before installation, check that the model is appropriate for the use.

Use this product correctly within the ranges specified in this user’s manual. Otherwise, gas leakage or device failure may result.
When unpacking this product, check the model number printed on the labels on the solenoid coil and valve unit to confirm that you have the model you ordered.

1. Check the model number printed on the labels on the solenoid coil and valve unit to confirm that you have the model you ordered.

2. Check the appearance for any apparent damage.

3. Check that all accessories are included.

Items indicated below are included with the product.

After unpacking, handle this product carefully to avoid damaging the unit or losing the accessories.

If there is any problem with your purchase, contact the azbil Group promptly.

* O-rings are used between the valve and the dedicated pipe flanges.

The GV-A gas solenoid valve (hereafter "this product") can be used for turning on or off gas burners and gas combustion equipment for natural gas, LP gas, etc., and as a safety shutoff valve.

This product was made by Elster GmbH and imported from Germany.

**Features**

- The product is composed of a valve body and a dedicated pipe flange.
- The double-seated valve allows larger gas flow and smaller piping port.
- The maximum operating pressure is 50 kPa.
- This product is available in both quick-open and slow-open types. The quick-open type has a mechanism for adjusting the maximum flow rate. The slow-open type has a mechanism for adjusting the initial gas flow rate and maximum flow rate.
- Models with POC (proof of closure) have a function to show whether the valve is shut off.
- With the blue LED, which is a standard feature, power status can be visually checked.
- The product complies with EN 161 Class A.
- The product has obtained SIL2 and PLd certification. When two GV-A units are connected in series, the product complies with SIL3 and PLe.

**SIL 3 (Safety Integrity Level 3)**

Safety system SIL safety certification must be received from a third party. SIL3 is the level at which risk is reduced between 1/1,000 and 1/10,000 of the risk at a plant where safety measures are not adopted. SIL1 indicates that risk is reduced to the 1/10–1/100 range.

**Performance Level (PL)**

The performance level indicates the ability of safety-related parts to perform a safety function. Hardware failure rates and software safety requirements were added to the qualitative requirements described in category B, items 1 to 4 in EN 954-1 and ISO 13849-1:1999 (JIS B 9705-1:2000) to provide quantitative safety levels designated from PLa to PLe.
This product is composed of the valve body and a dedicated pipe flange. The structure and part names are shown below.

**Main unit**

- O-ring A (already mounted)
- Strainer (already mounted)
- Bolt set (included)
- Flow direction mark
- Dedicated pipe flange (sold separately)
- M20 cable gland

**Models without a POC switch**

- Solenoid coil
- Terminal box
- Pressure measurement port

**Models with a POC switch**

- POC switch

**Slow-open type**

- Function inspection screw
- Damper unit

---

**Handling Precautions**

- Function inspection screw
  
  This screw is for function inspection by the manufacture. It is not for onsite adjustment. Please do not turn it. Doing so might cause an oil leak or prevent the valve from opening.

---

**PIPING**

**WARNING**

- After piping, check for gas leaks.
- Do not use this product with gas having a temperature that exceeds the specifications, gas that contains dust, gas that contains moisture, or condensed gas.

---

**CAUTION**

- Install this product vertically (with the solenoid coil facing upward) or horizontally (with the solenoid coil lying down).
- Do not allow sealing material or foreign matter caused by cutting pipe threads to enter this product.
- Do not install or store outdoors.
- For models with a POC switch, the solenoid coil cannot be rotated.
- When cleaning the actuator, do not use high pressure or a chemical detergent. Doing so will allow moisture to enter the actuator, and a dangerous failure may result.
- Do not supply gas with a pressure that exceeds the maximum operating pressure.
- If three or more GV series solenoid valves or GV series regulators with solenoid valves are connected, support the products with a stand, etc. Otherwise, the pipe may bend and gas leakage may result.
- Rotate the actuator, if necessary, before connecting valve units. (For models with a POC switch, the actuator cannot be rotated.)
- Use dedicated nuts to secure the flanges.
- Install this product in accordance with the relevant laws and standards.
- Install this product with appropriate tools.

---

**Handling Precautions**

- When screwing the product into the pipe, do not apply too much force to the valve unit. Doing so will damage the main unit or cause gas leakage.

**Before piping**

- Strainer check
  
  Check that the strainer is securely attached to the inlet of the upstream side valve unit.
- Air flushing
  
  Before installing this product on the piping, flush the pipes with air to remove metal shavings, burrs, and any other foreign matter.

**Piping**

1. Apply sealing tape or sealant to the male threads of the pipe.

Apply an appropriate amount of sealant, except on the two threads near the end.

**Correct**

**Incorrect**

- Too much sealant
- Burrs or other foreign matter in the pipe
Handling Precautions
• Sealant applied in large amounts or foreign matter in the pipes will clog the strainer and reduce the flow rate.

(2) Tighten the octagonal part of the dedicated pipe flange with a wrench.

(3) Check the flow direction, and insert this product between the upstream and downstream dedicated pipe flanges.

Handling Precautions
• Push the piping apart and insert the valve, taking care not to damage the O-rings attached to both sides of the valve.

• The O-rings should be set securely in the grooves of the valve. If the O-rings are not fitted well, the connection between this product and the piping may not be sealed completely.

• Attach the O-rings and the strainer before mounting the valve on the dedicated pipe flanges.

(4) Recheck the position of the dedicated pipe flanges and the gas flow direction. Tighten the bolts of the dedicated pipe flanges with a hex wrench.

Handling Precautions
• Bolt tightening torque is indicated below. Do not tighten the bolts excessively. Doing so will damage the bolts and may cause gas leakage.
  Bolt for valve size 1: 4.5 N·m
  Bolt for valve size 2: 8.0 N·m
  Bolt for valve size 3: 14.0 N·m

• Set the octagonal nuts and washers in the correct position as shown below. If they are in the wrong position, the bolt set will not fit into the flange and the valve unit completely. This would cause a loose connection between the flange and the valve, resulting in gas leakage.

[Diagram showing correct and incorrect positioning of nuts and washers]

WIRING

WARNING
Always connect this product to the low potential side (G). If connected to the high potential side (H), if a ground fault occurs, ground-fault current will enter this product and open the valve, causing gas to flow regardless of burner controller operation.

The connection between ground and the ground terminal of this product should have a maximum resistance of 100 Ω.

Make sure that there are no loose connections.

CAUTION
Make sure that there are no loose connections.

(1) Select a knockout for the power cable of this product.

(2) With the terminal box cover closed, remove the knockout with a tool such as a screwdriver.

(3) Remove the terminal box cover.

(4) Attach the power cable to the M20 cable gland that is supplied with this product.

(5) Pass the M20 cable gland through the knockout hole.

(6) Pass the cable through the nut inside the terminal box.

(7) Tighten the nut to secure the M20 cable gland to the terminal box.
(8) Connect the high potential (H) wire to LV1(+) and the low potential (G) wire to N(-).
Connect the ground wire to the ground terminal.

**Models without a POC switch**

![Diagram of Model without POC switch]

(9) Tighten the nut on the outside of the terminal box to secure the power cable.

(10) Put the terminal box cover back on the unit.

**Handling Precautions**

- If the POC switch is used with a low-voltage circuit, be sure to isolate the wires to the low-voltage circuit from the wires to the line voltage in order to prevent induction from the line voltage that drives this product.
- When wiring the POC switch, lift the connector off the board. After wiring, put the connector back in place without turning it upside down.
- If terminals at the bottom of the terminal box for the POC switch are used for internal wiring of this product, use the terminals at the top.
- Use cables that are heat resistant to 80 °C or more.
- The solenoid coil reaches high temperatures. Wire the cables so that they do not touch the coil.

---

**ADJUSTMENT**

### Maximum and initial gas flow rate adjustment

<table>
<thead>
<tr>
<th>Adjustment mechanism</th>
<th>Max. flow rate adjustment</th>
<th>Initial flow rate adjustment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Slow-open type</td>
<td>Approx. 20–100 % of max. flow rate</td>
<td>Approx. 0–70 %*</td>
</tr>
<tr>
<td>Quick-open type</td>
<td>–</td>
<td>–</td>
</tr>
</tbody>
</table>

* Initial flow rate < Maximum flow rate

#### Maximum flow rate adjustment

With 100 % as the flow rate when the valve is full-open, the flow rate can be adjusted within the range of approximately 20 to 100 %.

#### Initial gas flow rate adjustment

The initial flow rate is the flow rate of the gas that is supplied to the pipe immediately after the power is turned on.

A slow-open type of valve, which can adjust the initial gas flow rate to prevent detonation ignition, is available for this product.

When powered, the valve of the slow-open type opens slowly, taking approximately 10 s at a maximum. The flow rate immediately after power-on can be adjusted within a range of 0 to 70 % of the maximum flow rate.

---

**Adjusting the maximum flow rate**

The position for maximum flow rate is set at the factory. Adjust the maximum flow rate according to the application.

Turn the flow rate adjustment screw with a hex wrench.

![Diagram of Flow Rate Adjustment]

**Adjusting the initial gas flow rate (for the slow-open type only)**

The time required for the valve to open depends on the initial gas flow rate that is set.

The factory default is 0 %. Adjust the initial gas flow rate according to the application.

**Note**

- The damper unit can be rotated for up to five full turns.
- To make the damper unit work perfectly, it is necessary to allow an interval of at least 20 s after the valve is closed and before the power is turned back on.

(1) Loosen the setscrew with a hex wrench.

(2) Turn the damper unit clockwise (tightening) to reduce the initial flow rate, and counter-clockwise (loosening) to increase the rate.

(3) Tighten the setscrew with a hex wrench.
**MAINTENANCE**

**WARNING**

- Check the gas solenoid valve for both external and internal leakage at least once a month.
- After piping and wiring, be sure to check for leaks before introducing gas into the piping. Failure to do so may cause fire or device failure.

**CAUTION**

When discarding this product, please dispose of it as industrial waste, following local regulations.

---

**External leakage**

Close manual regulating valves 1 and 3 in the figure in Leakage (page 6), and check for a leak with a gas detector or leak detection fluid.

Incorrect

Incorrect

**Handling Precautions**

- If gas is leaking from the dedicated pipe flanges (external leakage), check whether components of the seal such as the O-rings are properly attached (if not, attach them properly) and free from damage. Replace any damaged components of the seal.

**Internal leakage**

Close only manual control valve 1, connect a rubber hose to manual control valve 3, and then place the other end 10 mm deep in water to see if any bubbles come out.

**Leakage**

GV-A100/200: 40 mL/h max.
GV-A300: 60 mL/h max.

Note: The above figures are for a pressure of 50 kPa and include both internal and external leakage.

---

**REPLACING A VALVE UNIT**

1. Disconnect the power cable and the cable for the POC switch.
2. Shut off the gas.
3. Remove the bolts that connect the dedicated pipe flange to the valve unit.
4. Pull out the valve unit.
5. Check that the O-rings, connecting O-ring, strainer, and retaining frame are not damaged.
6. Attach the strainer, retaining frame, new O-rings and connecting O-ring to the new valve unit.

- **When a single unit is used**

- **When two units are connected**

7. Install the product. [PIPING (page 3)](#), [WIRING (page 4)](#) and the user’s manual for the combustion equipment.
8. Check for internal and external leakage. [MAINTENANCE (page 6)](#) and the user’s manual for the combustion equipment.
(9) Adjust the maximum and initial gas flow rates.

Handling Precautions

- When removing only one of two connected valve units, remove both units from the dedicated pipe flanges, and then detach one from the other.
- When installing or removing valves, replace the components of the seal.

Connecting two valves in series

The parts shown in the figure below are necessary to connect two valves in series.

First, connect two valve units and attach the dedicated pipe flanges to the pipe. Then, insert the valve units between the flanges.

Connecting terminal boxes

Handling Precautions

- For models with a POC switch, the direction of the terminal box cannot be changed.
- For models without a POC switch
  - For single valve configuration:
    The direction of the terminal box can be changed.
  - For double-valve configuration:
    For valve size 1 and 2, the adjacent coils interfere each other. Therefore, the direction of the terminal boxes can be changed only in 90-degree increments. The direction cannot be changed after the valve units are connected. For valve size 3, the direction of the terminal boxes can be changed after the valve units are connected.

Note

- If the upstream and downstream valves are wired independently, it is not necessary to connect the terminal boxes.

Connecting method

(1) With the terminal box cover closed, remove the knockout from the connecting side with a tool such as a screwdriver.

(2) Remove the terminal box cover.

(3) For the GV-A200 and the GV-A300, remove the ground terminal (supporting hex bolt: width across flats = 8) at the center of the terminal box.

(4) Attach the cable bushing.

(5) For the GV-A200 and the GV-A300, put the ground terminal (supporting hex bolt) back in the original position. (Recommended tightening torque: 3.0 N·m)

(6) Put the terminal box cover back on the unit.

Note: A dedicated pipe flange (sold separately) that is appropriate for the pipe size is necessary.

### PARTS SOLD SEPARATELY

**WARNING**

Installation of parts sold separately for maintenance, etc., should be carried out only by specialists with sufficient knowledge and technical skill concerning combustion and industrial furnaces.

After installing parts, carry out inspections, such as a gas leak check.

• Dedicated pipe flange

One dedicated pipe flange is included. Two flanges are required for one valve unit.
